

### Project 3

For my third project I decided to make an incense burner for my dad. My original plan for this incense burner was to make a burner out of a pokemon. I downloaded the model of the pokemon and hollowed it out to place the incense inside. When I was checking the structural integrity of the base it fell apart. I decided to restart and make my burning from scratch. The chimney is based off of my original design but I changed it to allow for bigger con incenses to be placed inside.

My dad is very much into African culture and I was thinking if I was able to print this out of clay and paint African symbols on it he would really appreciate it.

My main narrative for this project is how can my print be useful. When I think of 3D printing an object I want it to have some sort of use, whether it be momentary or long term, mostly long term. The use of the incense burner is long term. My dad can use it over and over as much as he likes.
