

When looking at a geode, the outside looks just like an ordinary rock. But crack it open and the inside is full of beautiful crystal. Usually, it is hard to tell if a rock is a geode, because the outside looks like rock. This 3D sculpture shows that there is more on the inside than the outside. The shape of crystals just look organic and not manmade, and they come from the Earth. The Earth has a lot to offer than what it seems.
